STATINTL

Dear Jack:

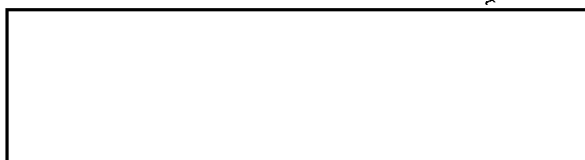

Enclosed is another run of the MTF program using a different set of data (same exposure table). The traces for this job all began at about the same location with approximately the same number of samples per edge. The density values are listed along with the corresponding exposure values.

Also enclosed is a run of the SINC program and the traces used as input. SINC-type edges were used as input.

For documentation purposes, could you send descriptions of all output values in the MTF program along with the possible range of the values.

Sincerely,

STATINTL
